Analysis of plant volatile emission- linking chemistry and behavior

Robert Glinwood

[a] Dept. of Crop Production Science, Swed. Univ. of Agricultural Sciences (SLU), Uppsala, Sweden

Plants release volatile organic compounds into the atmosphere, and these emissions can affect the behavior of insects and even other plants. I present the approach used for the collection and analysis of plant volatiles in my laboratory, illustrated with examples showing the diversity and sensitivity of plant volatile emissions. Understanding the effects of plant volatiles on other organisms can give opportunities for sustainable plant protection.
