

Urban biodiversitet och design

This research field focus on theoretical, methodological and practical approaches to sustainable landscape design in the era of globalisation with an emphasis to urban biodiversity and design. Today the process of globalisation is associated with using similar urban design and planning structures, landscape architecture styles, plants and construction materials around the world. Urban biodiversity as part of planting design can play an important role for ecological and national identity of cities. Research of cultural landscapes and their potentials are seen as an essential part in this research field.

Ongoing research projects:

Sustainable landscape design is a part of a broader concept of Sustainable Cities as Resilient Citylands (SUCAR) which is a research project developed at the unit of Landscape architecture with partners in Europe.
