

The Pyrethroid Challenge

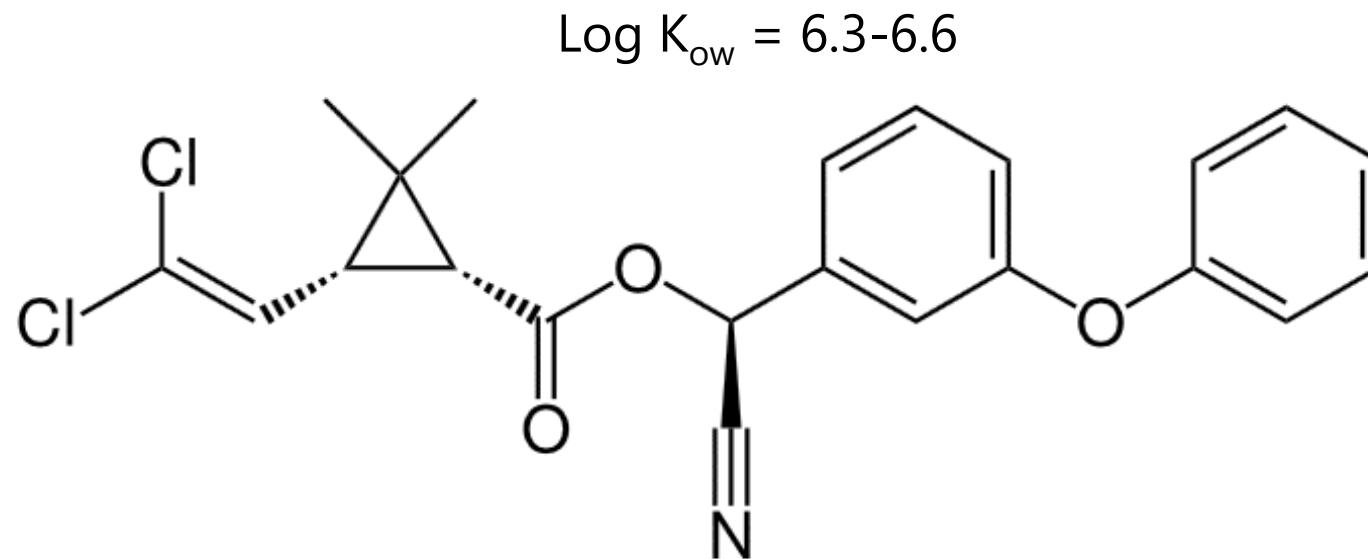

Natural organic matter coated particles as vectors for pyrethroid exposure in stream water

UNIVERSITY OF COPENHAGEN

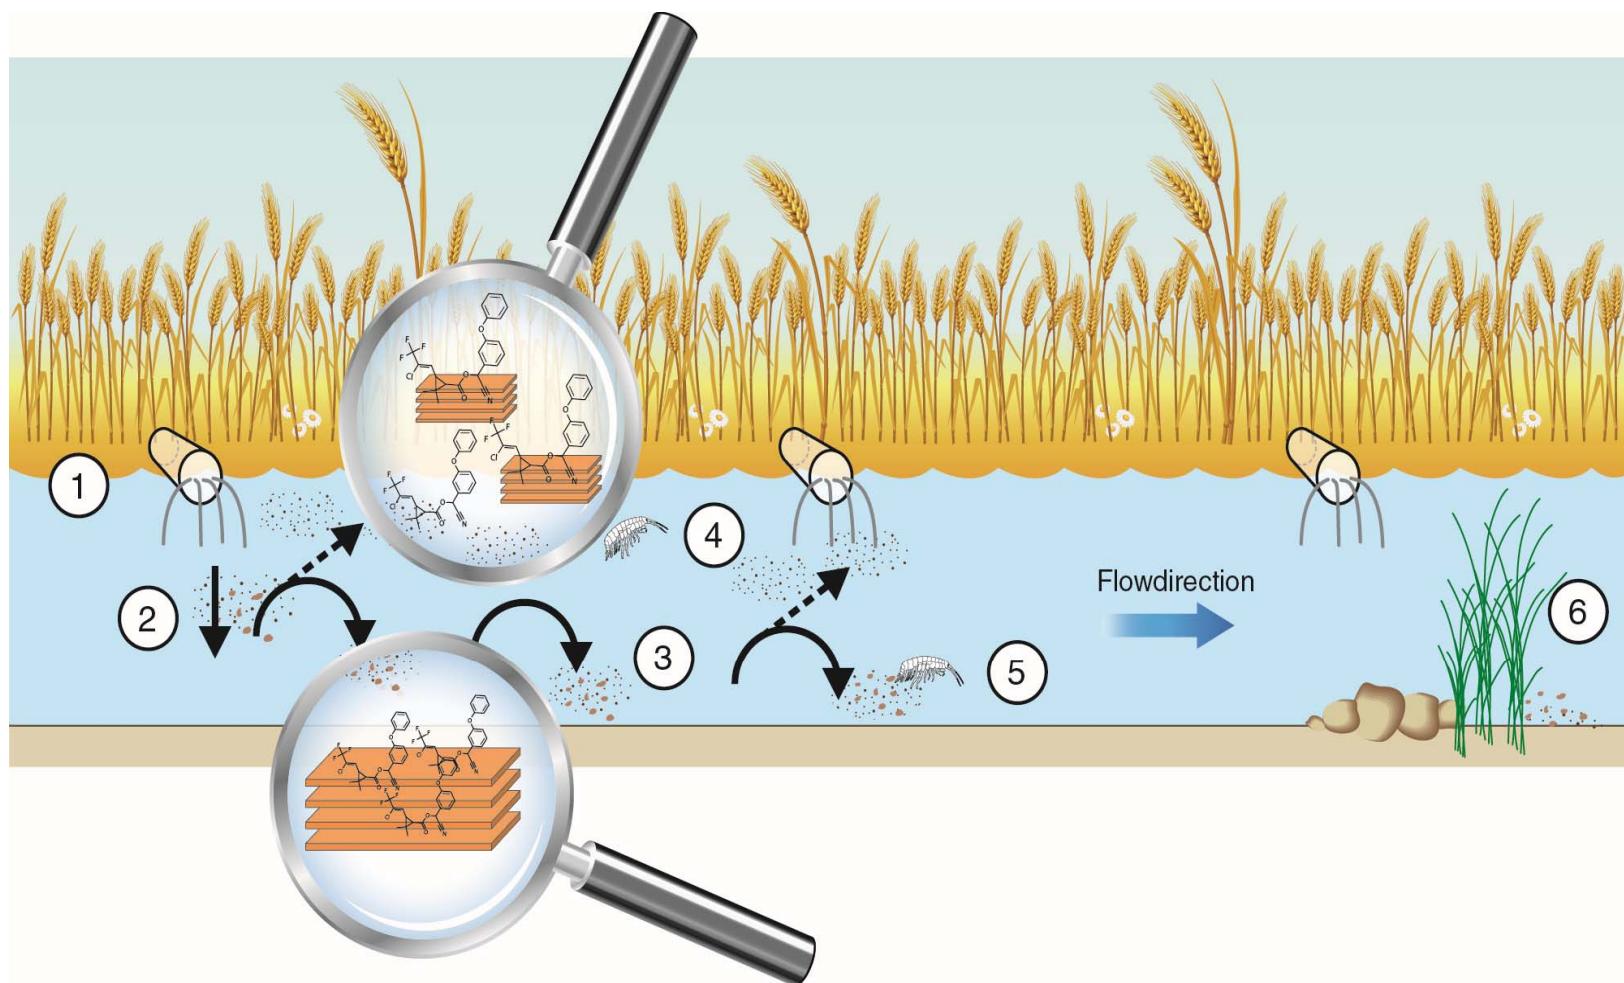

Cypermethrin – a hydrophobic insecticide

- Cypermethrin has been found in surface waters
- Particles transport cypermethrin
- Particle bound cypermethrin has been found to be toxic
- Leaching of fine particles happen in pulses, approx. 60 min (rain events)

Effect of particle-associated pyrethroids for toxicity towards freshwater macroinvertebrates

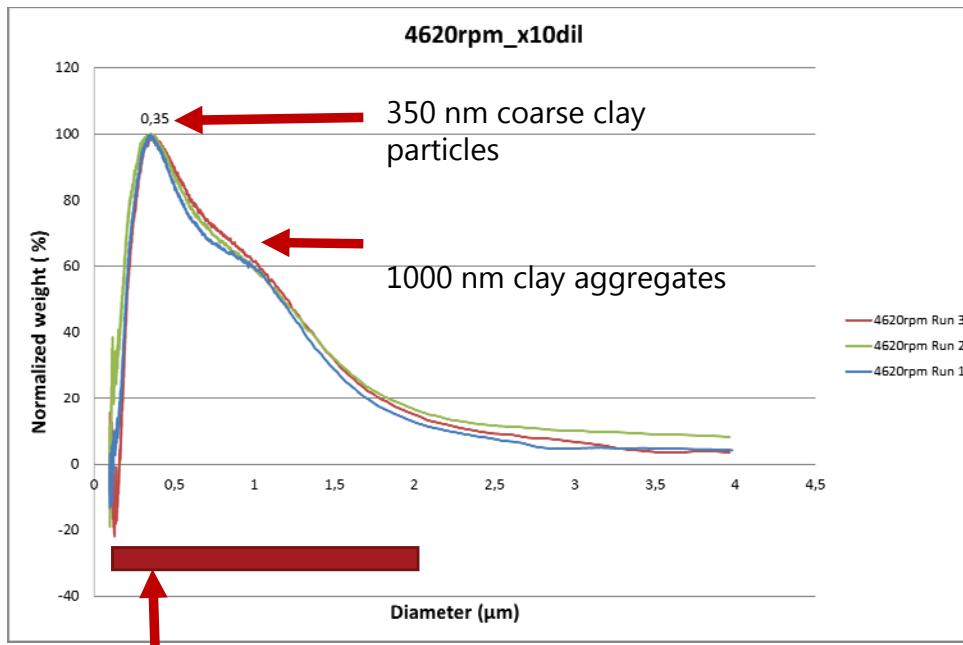

Aim

- To determine the potential of goethite and montmorillonite to act as vectors for cypermethrin transport with and without coating with organic matter
- Goethite
- Goethite + DOM coating
- Montmorillonite
- Montmorillonite + DOM coating
- Particle size distribution in Göteborg @Geert Cornelis lab

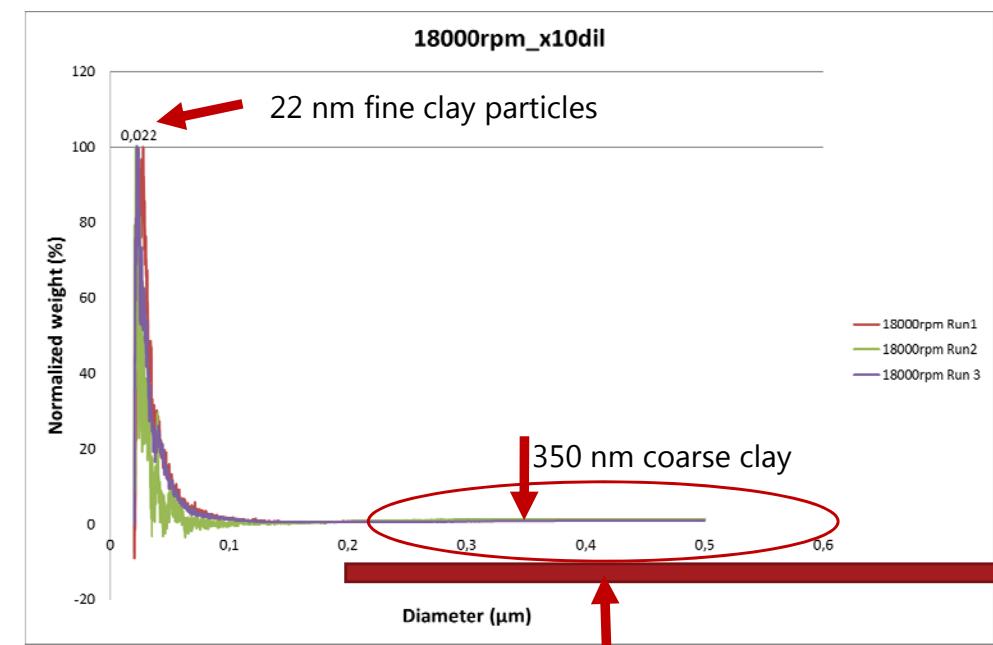

Particle properties for pyrethroids sorption

**Montmorillonite coarse fraction in 3 replicates
100 - 4000 nm (low resolution)**

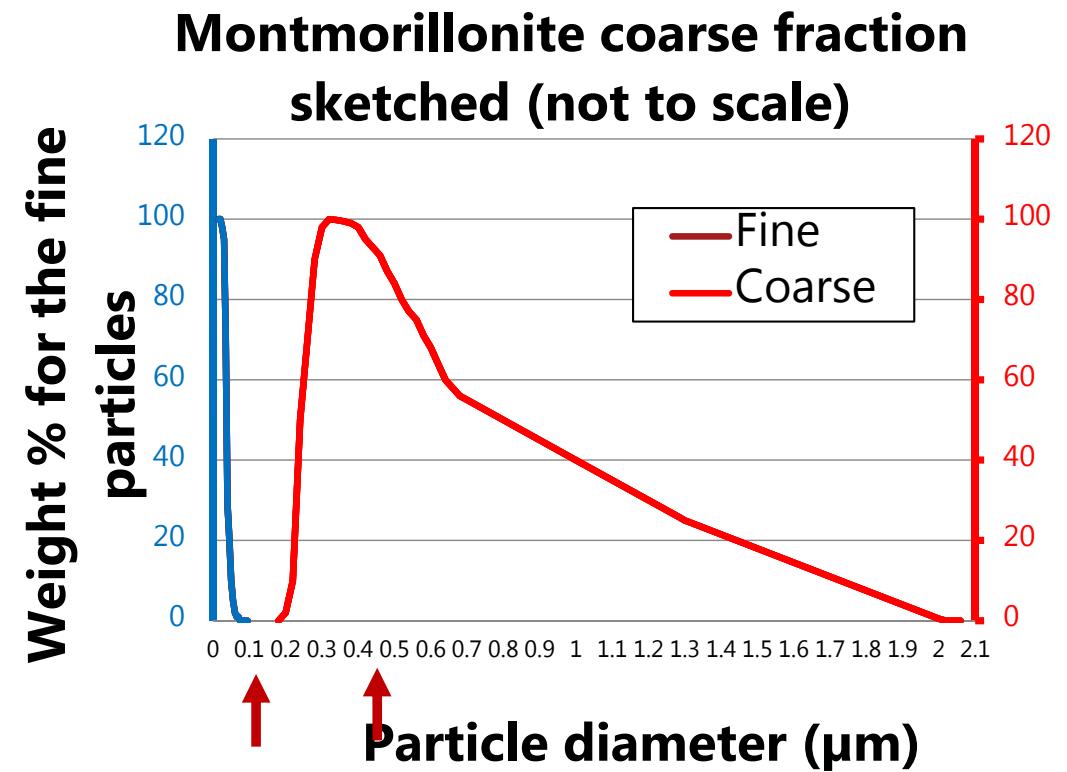

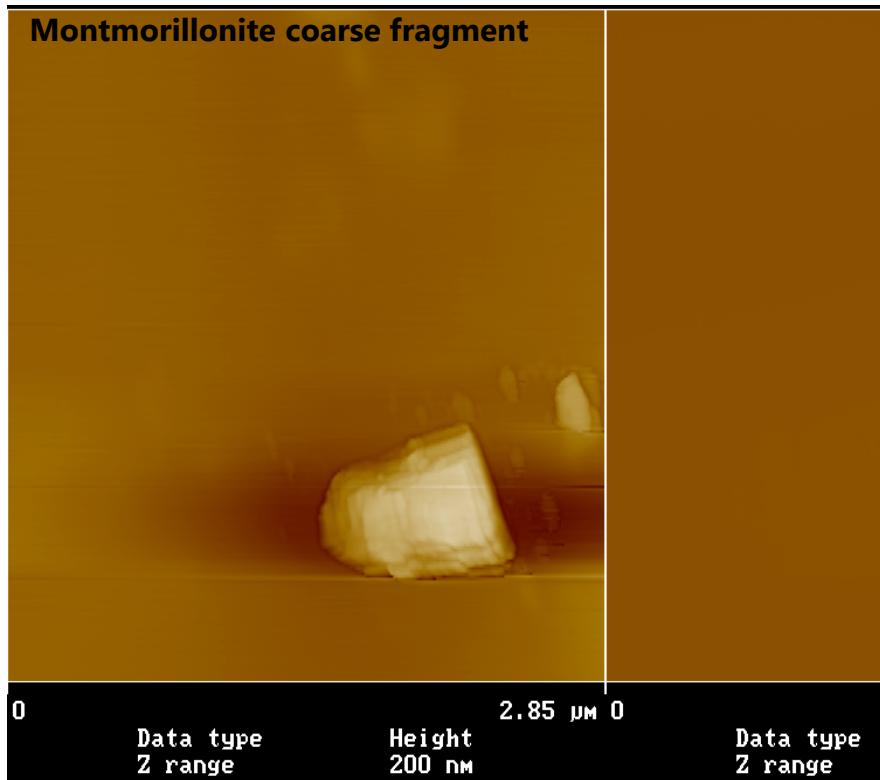

200 – 2000 nm coarse
clay

**Montmorillonite coarse fraction in 3 replicates
20 - 500 nm (high resolution)**

200 – 2000 nm coarse
clay

Particle properties for pyrethroids sorption

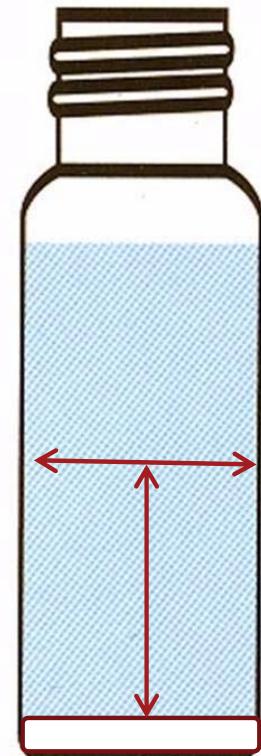

Coarse particles can be sedimented by ultra-centrifugation
Fine clay particles (<100 nm) stay suspended after ultra-centrifugation

The challenges of hydrophobic compounds in sorption studies

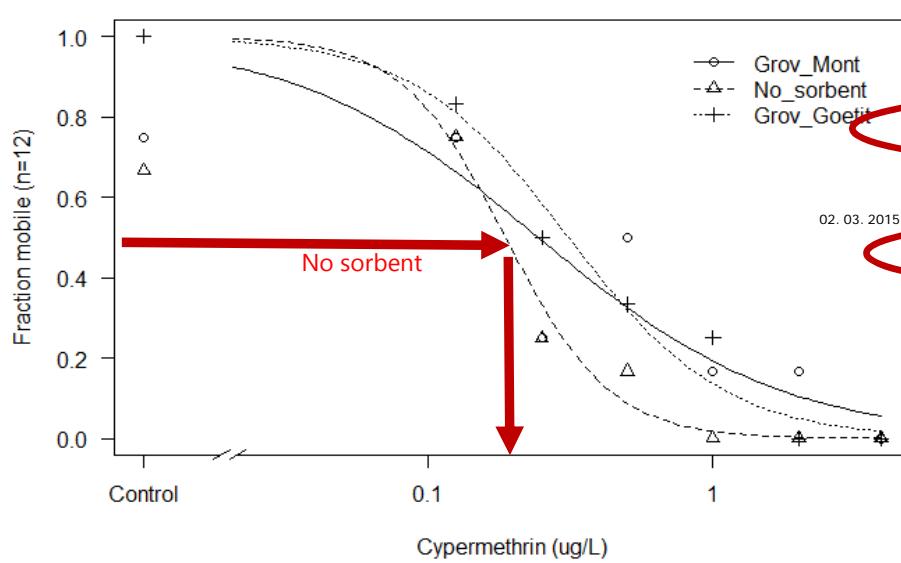

- How to control the cypermethrin concentration?
 - A source of cypermethrin which can counteract sorption is needed
 - Water concentrations are controlled by an equilibrium
 - Silicone has a high affinity for hydrophobic compounds
 - High loading with cypermethrin is needed

$$K_d = \frac{c_{silicone} \left[\frac{\mu g}{kg} \right]}{c_{softwater} \left[\frac{\mu g}{L} \right]} = \left[\frac{L}{kg} \right]$$

Ecotox effects of particle-associated pyrethroids

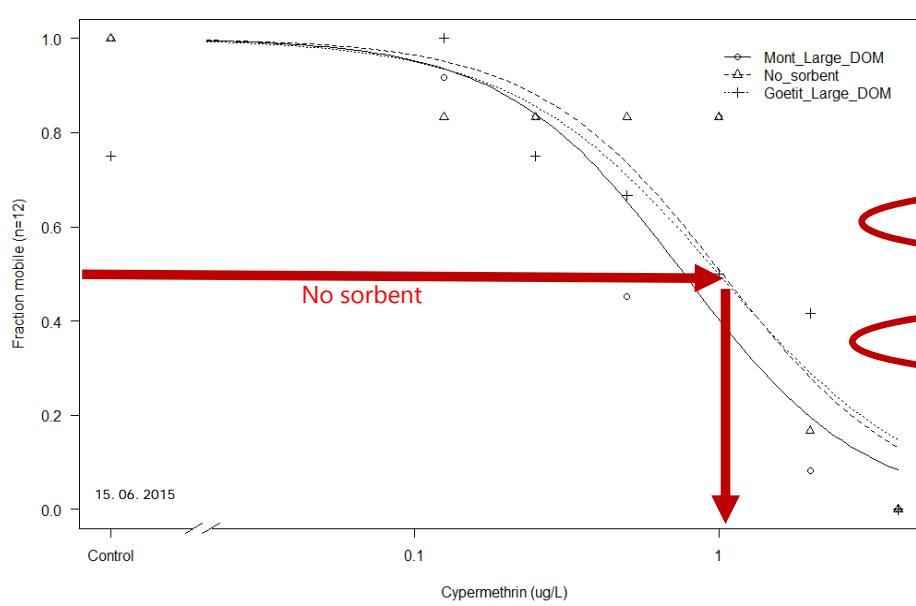

- Toxicity of sorbed and dissolved pyrethroids (4×3 fractions from 1A) to *G. pulex* (pulse exposure)

Treatment	M_coarse e (mg/l)	M_fine (mg/l)	G_coarse e (mg/l)	OM (mg C/l)
Coarse montmorillonite	25			
Coarse montmorillonite + NOM	25			0.21
Coarse goethite			25	
Coarse goethite + NOM			25	0.21
Fine montmorillonite		5		
Fine montmorillonite + NOM		5		0.21
Organic matter				0.21
Coarse montmorillonite + NOM	25			5
Coarse goethite + NOM			25	5

Ecotox effects of particle-associated pyrethroids

- Toxicity of sorbed and dissolved pyrethroids (4×3 fractions from 1A) to *G. pulex* (pulse exposure)

Treatment	M_coars e (mg/l)	M_fine (mg/l)	G_coars e (mg/l)	OM (mg C/l)
Coarse montmorillonite	25			
Coarse montmorillonite + NOM	25			0.21
Coarse goethite		25		
Coarse goethite + NOM		25	0.21	
Fine montmorillonite		5		
Fine montmorillonite + NOM		5		0.21
Organic matter				0.21
Coarse montmorillonite + NOM	25			5
Coarse goethite + NOM		25	5
