Lof M, Brunet J, Filyushkina A, Lindblad M, Skovsgaard JP, Felton A (2016) Management of oak forests: striking a balance between timber production, biodiversity and cultural services, International Journal of Biodiversity Science, Ecosystem Services & Management, 12:1-2, 59-73

Aspenäs, September 2007

Typical oak forest

A successful oak regeneration

- Plant material (seeding, planting, sprouting, advanced regeneration)
- Lots of light
- Interspecific competition
- Browsing pressure

Regeneration: The First Pillar of Sustaining Oak Stocking

Sources of Reproduction: New Oak Seedlings

Shoot and root same age

Carbon allocation:

To roots

Slow juvenile shoot growth

Sources of Reproduction: Oak Sapling Sprouts

Root and shoot different ages due to shoot dieback/ browsing and sprouting

Sources of Reproduction: Oak Stump Sprouts

Sprouts arising from cut stems > 5 cm dbh

Fastest growing source of reproduction

Stocking insufficient to maintain composition

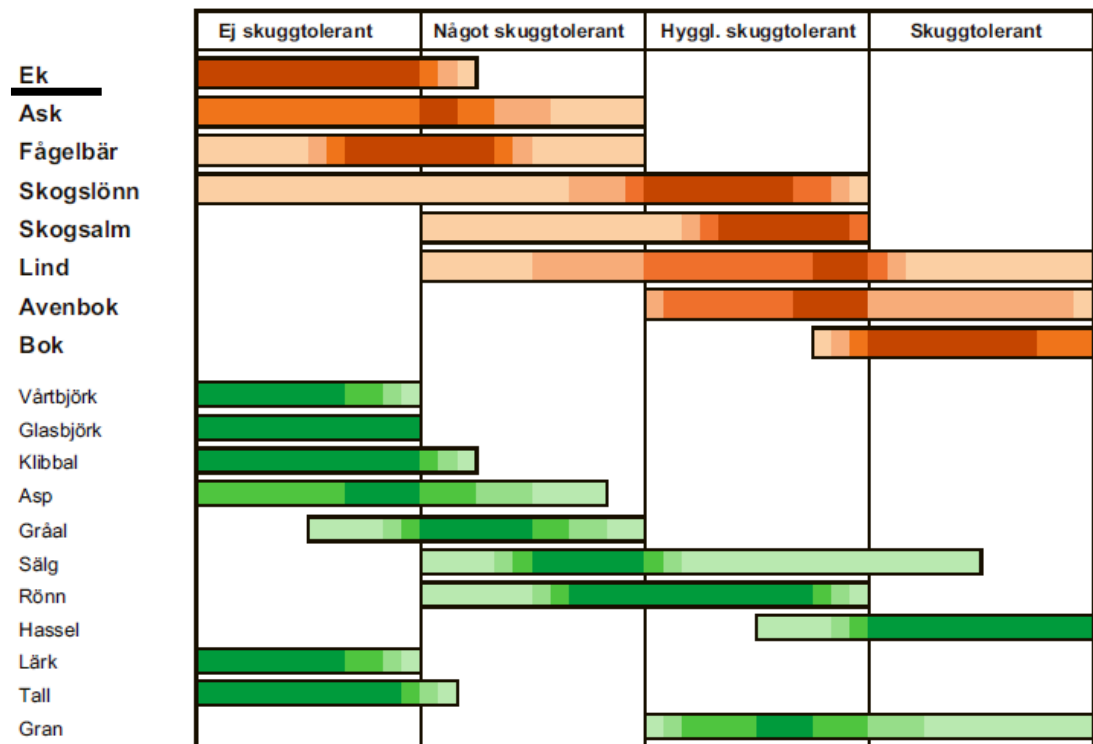

Sensitive to low light (competition)

Sensitive to browsing

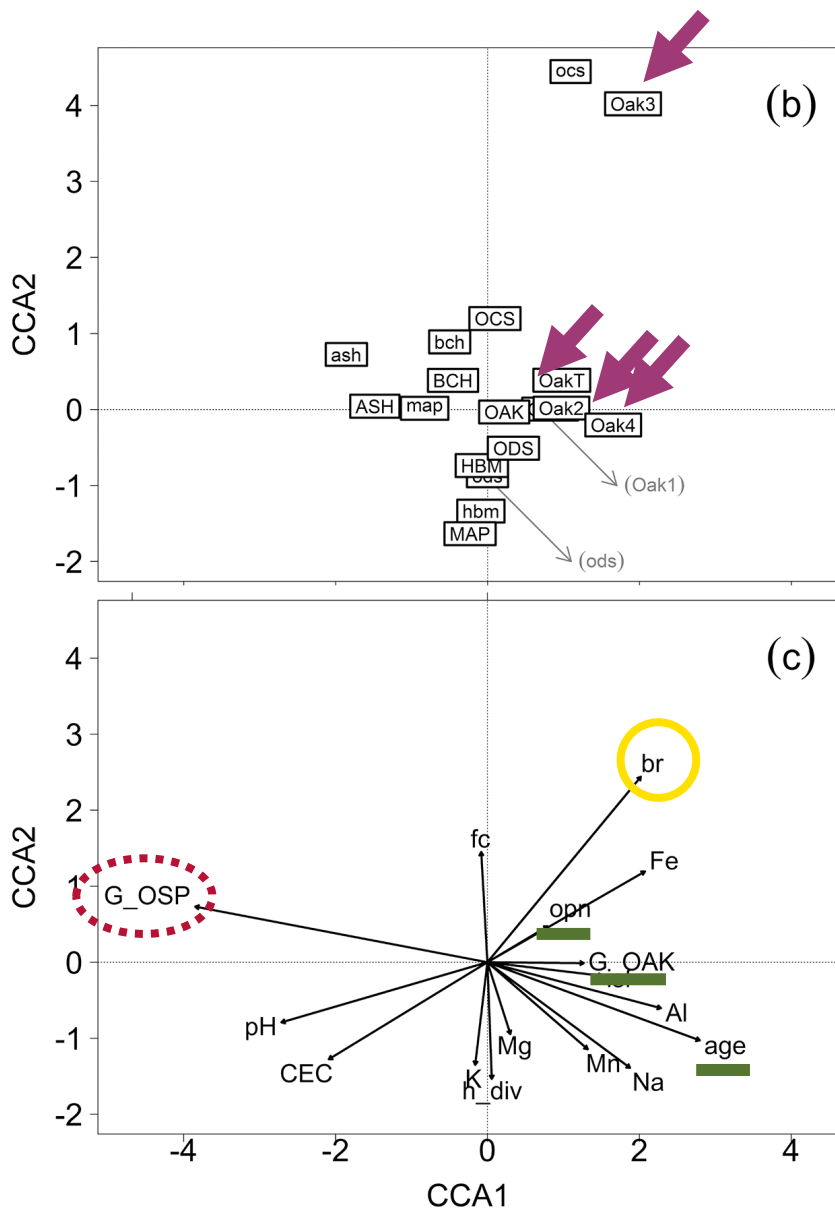

A successful oak regeneration

- Plant material (seeding, planting, sprouting, advanced regeneration)
- Lots of light
- Interspecific competition
- Browsing pressure

Light, neighborhood and browsing

- Regeneration patterns differ depending on developmental stage (height)
- Increased oak regeneration can be expected with increasing light availability (opn, isf), stand age and basal area of oaks (G_OAK).
- Oak regeneration between 50 and 130 cm tall seem to be related to browsing (br)

An acorn

- Seed trees ↑
- Acorn size ↑
- Good or bad germination year

Oak 1
≤ 20 cm

- Overstory composition is important: oak over story basal area ↑
- Soil Fe content ↑

Oak 2
20-50 cm

- Basal area for beech in the over story ↓
- Browsing ↗

Oak 3
50-130 cm

- Browsing ↗

Oak 4
> 130,
< 7 cm, dbh

- Light availability ↑

Age or size of the oak seems to matter
 – risk of being browsed
 – within plant available recourses

A successful oak regeneration

- Plant material (seeding, planting, sprouting, advanced regeneration)
- Lots of light
- Interspecific competition
- Browsing pressure

Solutions ?

Avoid damage

- Fence
 - Individual trees
 - Group of trees
 - Permanent or temporary
- Repellent
- Use stand structures as a mean of avoiding damage
- Don't plant oak

Increased interspecific competition

→ Increased operating cost

→ Reduced timber quality

How? We lack knowledge and practical experience

Solutions ?

Avoid damage

- Fence
 - Individual trees
 - Group of trees
 - Permanent or temporary
- Repellent
- Use stand structures as a means of avoiding damage
- Don't plant oak

Increased interspecific competition

- Increased operating cost
- Reduced timber quality

How? We lack knowledge and practical experience

When damage

- Pruning
- Prolong regeneration
- Non-traditional forms of regeneration
- Use stand structures as a means of limiting browsing

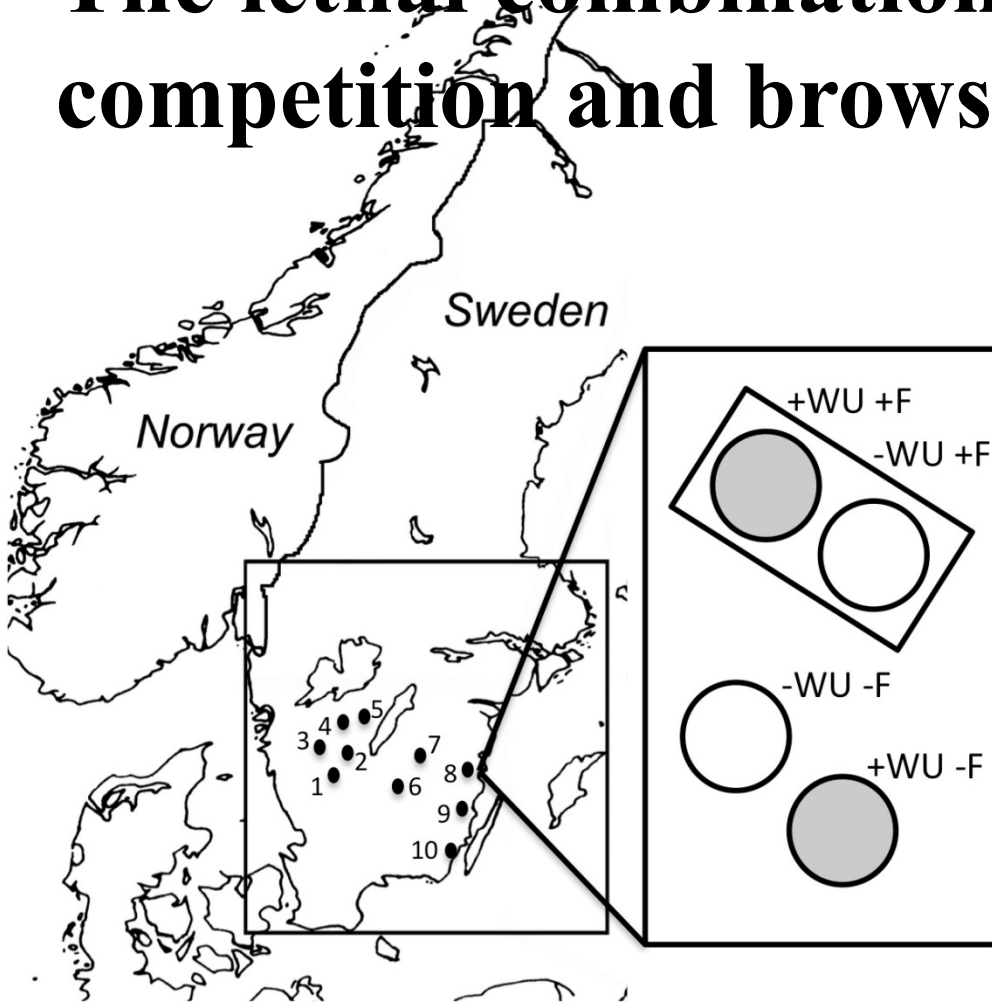

Increased operating cost?
Reduced timber quality?

How? We lack knowledge and practical experience

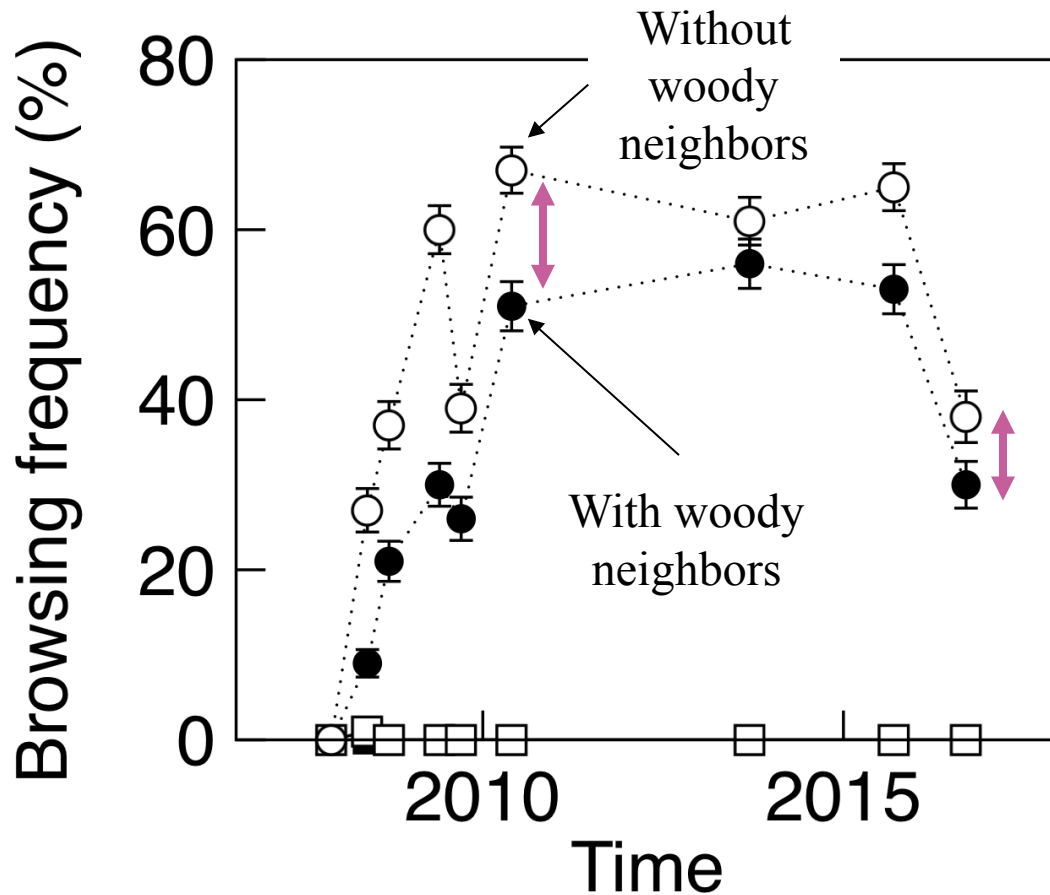

Using stand structures as a means of limiting browsing

The lethal combination of competition and browsing

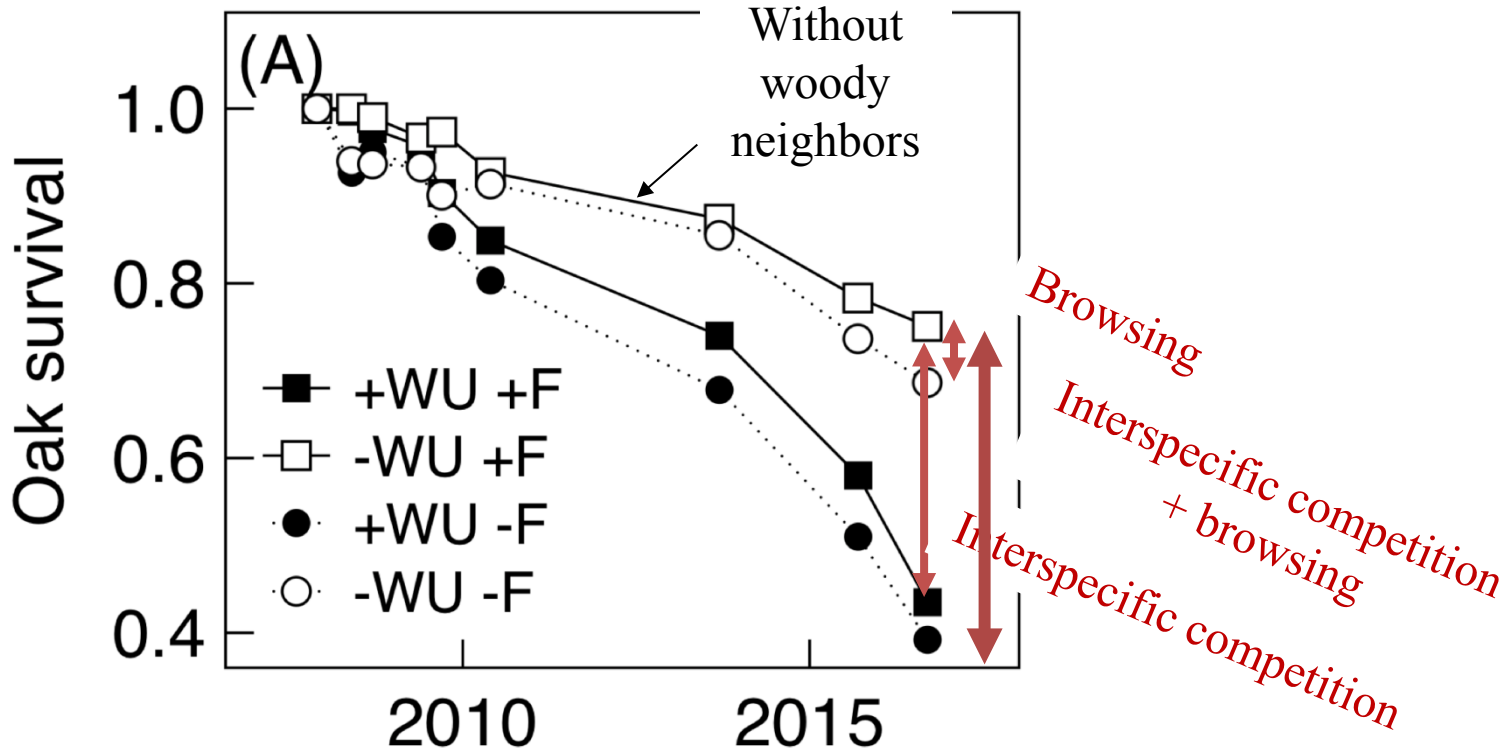

Does woody understory vegetation reduce browsing?

Significant protection by neighboring vegetation - between 5-30 percent unit

How are the oaks doing?

- **Browsing less important compared to competition.**
- **However, the combination of browsing and interspecific competition is a lethal combination for the oak**

How are the oaks doing?

Growth loss due to interspecific competition.

Growth loss due to browsing.

- **Browsing less important compared to competition.**
- **The combination of browsing and interspecific competition is really bad.**

Can these oaks escape by growing tall?

Is browsing really that bad?
