

# Centre for genetic identification

DNA 'barcoding' and eDNA

[Thomas.Lyrholm@nrm.se](mailto:Thomas.Lyrholm@nrm.se)

## DNA 'barcoding'

- Species are genetically unique
- Identification by short, standardised DNA sequences
- Globally accessible reference databases (BOLD) ( connected to GenBank)
- Taxonomic vouchers!
- Global coordination: *CBOL Consortium and iBOL*  
[www.barcodeoflife.org](http://www.barcodeoflife.org)

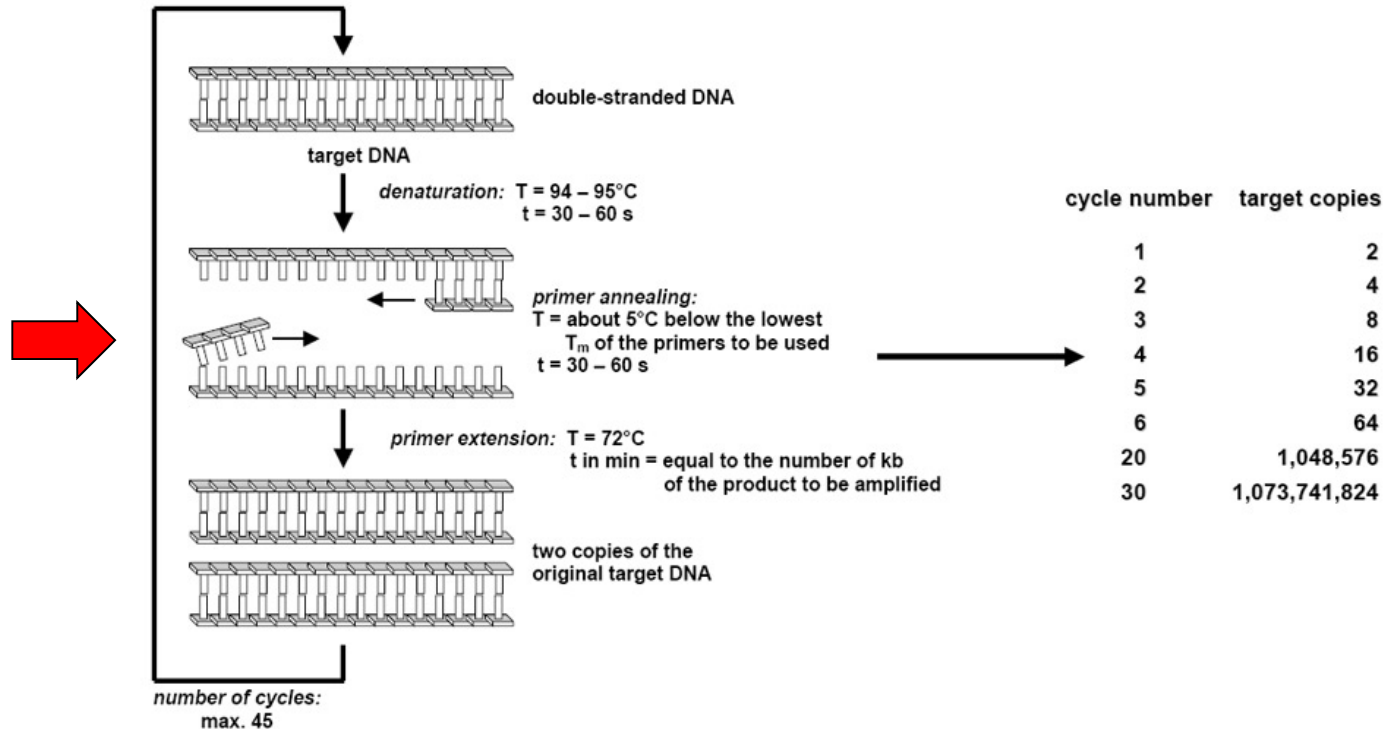

500 000 species (2015)

## Taxonomic identification by DNA

- Amplify by PCR and sequence the DNA fragment
- Compare against the taxonomically validated sequence database
- Taxonomic assignments based on sequence similarity
  - 'threshold' (e.g.. 99% similarity=same species)
  - Tree clustering (e.g. Neighbour joining)

# Primers och probes used to copy by PCR and analyze

## Suitable primers for general species identification

- The amplified sequence should show little variation **within** and high divergence **between** species
- Specific, robust PCR amplification with 'universal' primers
- Phylogenetically informative for species delineation
- Not 'too long' fragment
- Animals: mtDNA CO1 (658 bp)
- Plants: chl rbcL (500 bp); matK (800 bp)

## Sequencing

## Database comparison

## Improvements to environmental monitoring

- More reliable identification of taxa –to species level
- Very small amounts of source DNA needed (hair, excretions, pawprints, insect parts, cell....)
- Expansion to new taxa otherwise difficult to identify morphologically; cryptic species; biodiversity assessments
- Any lifestages can be used (any season)
- Less dependent on taxonomic expertise
- Time and cost savings
- Early warning (invasive species, pests, etc.)
- Non-invasive tracking of rare and endangered species
- <sup>8</sup> • Data accessible and searchable

## Monitoring questions

- *Which species?*
  - 'Barcoding' – compare barcode sequence to database
- *Is species A present?*
  - Detect species specific sequence in sample
- *Species composition in community?*
  - 'Metabarcoding' – identify many species in bulk sample
- *Is there a lot or little of species A?*
  - Species specific detection with quantitative PCR
- *What are the relative abundances of A, B, C..?*
  - Multiplex quantitative PCR; 'Next Generation Sequencing'

# Quantitative PCR, qPCR

Från Gibson (2006),  
Clinica Chemica Acta 363

## Real time

### Elements of the TaqMan technology

#### Step 1. Primer and probe annealing

#### Step 2. Primer extension with Taq DNA polymerase

#### Step 3. Release of probe fragments with increase in fluorescence

## Improved environmental monitoring in the Baltic Sea by DNA barcoding of Chironomids

- Naturvårdsverket, Havs-och Vattenmyndigheten, Gunilla Ejdung
- NRM: Yngve Brodin, Bodil Cronholm, Erik Ersmark, Veronika Nyström Edmark, Jonas Strandberg

## Chironomidae (non-biting mites) (Diptera)

C:a 650 species in Sweden, about 230 in the Baltic Sea  
(Brodin 2011)

## Chironomid larvae

- Ecologically important; up to 30% of macro zoobenthos biomass
- Important environmental indicators, different species vary in sensitivity (oxygen depletion, eutrophication)
- Difficult to identify morphologically – experts identify <20%
- Lumped into 'Chironomids' in traditional environmental monitoring
- Included in Benthic Quality Index (BQI)

## DNA barcoding of chironomids

- **Aim:** Reliable and cost-effective species identification
- **Purpose:** Improved assessment of biodiversity and of the environmental quality index BQI
- **Questions:** Which species occur in the benthic samples from different stations? In what proportions? How does this relate to environmental variables?

samlingar

DNA analys

Matchning mot referensdatabas

Provtagning

**Artlista**

- Chironomus apralinus
- Chironomus pallidivittatus
- Chironomus plumosus
- Chironomus pseudothummi
- Chironomus salinarius
- Cladopelma virescens
- Cladotanytarsus difficilis
- Cladotanytarsus mancus
- .....

**Miljötilståndsex**

## Present reference database

- > 800 sequenced individuals from the Swedish Baltic coast
- Standard barcode (mtDNA COI 650 bp)
- About 150 identified species (of about 200)
- near 100% accurate species identification

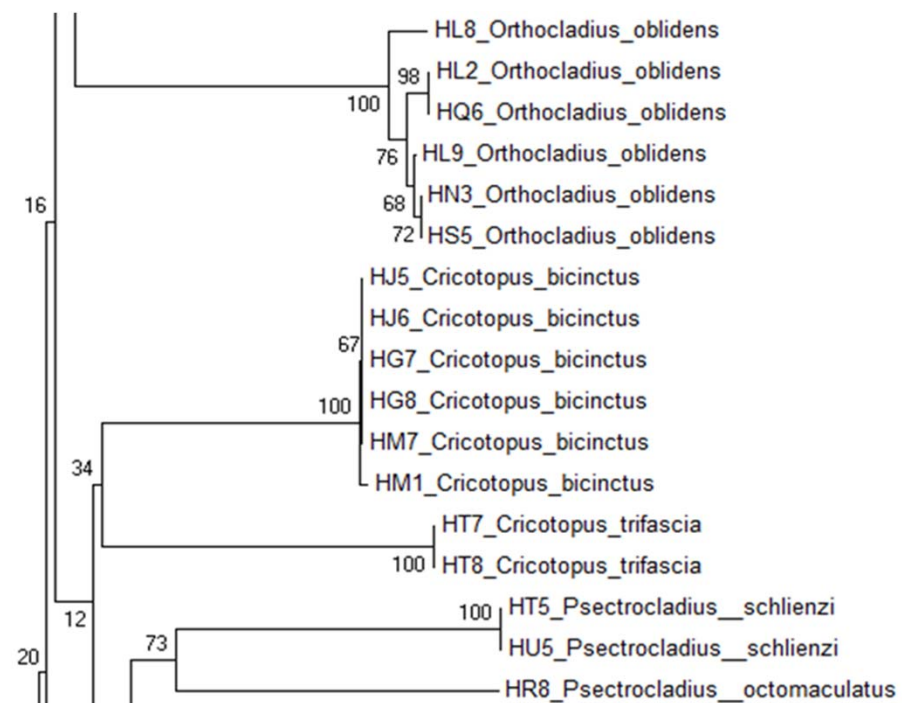

'NJ' tree of chironomids

Monophyletic species clades with short branches

Long interspecific branches

Different individuals of the same species in the same clade

Reliable species identification

## Invasive alien species

Gammarids (pilot study)  
Early warning – Where has it  
spread?

*Gammarus tigrinus* (invasive)

Naturvårdsverket

*Gammarus zaddachi* (native)

## **eDNA ('environmental DNA'); metabarcoding**

- DNA in environmental samples (water, air, soil, etc)
- Diet samples (faeces, gut, excretions, blood, etc)
- No manual separation of individuals
- Complex mixture of organisms/DNA
- Small, degraded pieces of DNA
- Cellular, extracellular, free DNA or particle bound
- New 'minibarcodes' needed

Small, degraded pieces of DNA

DNA detected in water 1 day-1 week

## Universal DNA 'mini-barcode' (Meusnier et al. 2008)

Accuracy mtCOI:

650 bp: 97%

250 bp: 95%

100 bp: 90%

Problematic to design universal internal primers covering variable region?

22 Develop new barcodes.

## Bullfrog, 72 bp mtDNA cytb (Ficetola et al. 2008)

Table 1. Rate of bullfrog detection in water samples.

pond	bullfrog presence and relative abundance	water samples positives at least once	positive PCRs
1	yes-low	2/3	2/9
2	yes-low	3/3	6/9
3	yes-low	2/3	2/9
4	yes-high	3/3	8/9
5	yes-high	3/3	6/9
6	yes-high	3/3	8/10
7	no	0/3	0/9
8	no	0/3	0/9
9	no	0/3	0/15

## Example: Perch in the water?

PCR primers for perch

Yes! Perch detected (Ab)

But also ruffe!(Gä)

More specific primers needed (or optimized PCR)

## Detection of limnic fauna using qPCR (finding selected species)

Proportion of positive detections at known occurrences

DNA concentration at varying frog densities

## Some sampling issues

- Replicates - increase detection probability, account for spatial variation, temporal variation, etc
- Blanks – negative controls to check for contamination (sampling, extraction, PCR)
- Positive controls – PCR reactions working, primer design, etc.
- Plan sampling together with the lab

## Alternative 'minibarcodes' gene regions

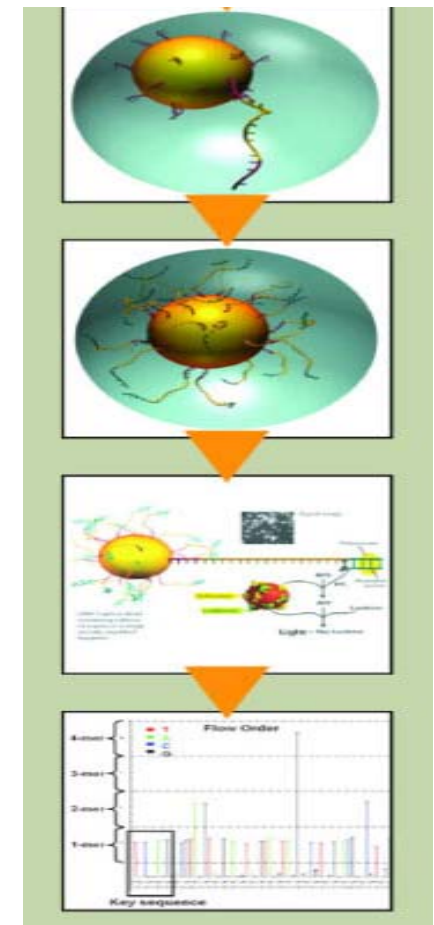

### A collection of metabarcoding primers

Taxonomic group	Gene	Length	Accuracy (Bs)
Angiosperms/Gymnosperms	cpDNA <i>trnL</i> intron	10-100 bp	Genus/Species
Poaceae	ITS1	54-88 bp	Species
Fungi	ITS1	~ 200 bp	Species ?
Vertebrates	mtDNA 12S V05	76-110 bp	Genus/Species
Teleost fishes	mtDNA 12S	60-70 bp	Species
Batrachia	mtDNA 12S	~ 42-57 bp	Species
Earthworms	mtDNA 16S (ewB/ewC)	~ 30 bp	Species
Earthworms	mtDNA 16S (ewD/ewE)	~ 70 bp	Species
Oligochaetes	mtDNA 16S (ewB/ewE)	~ 120 bp	Species
Arthropods/Mollusks	mtDNA 16S	35-40 bp	Family/Genus
Termites	mtDNA 12S	~ 30 bp	Species ?
Termites	mtDNA 12S	~ 70 bp	Species ?
Collembola	mtDNA 12S	39-44 bp	Species ?
Collembola	mtDNA 12S	125-138 bp	Species ?

More information soon on [www.metabarcoding.org](http://www.metabarcoding.org)

## Next Generation Sequencing (454, Illumina, etc.)

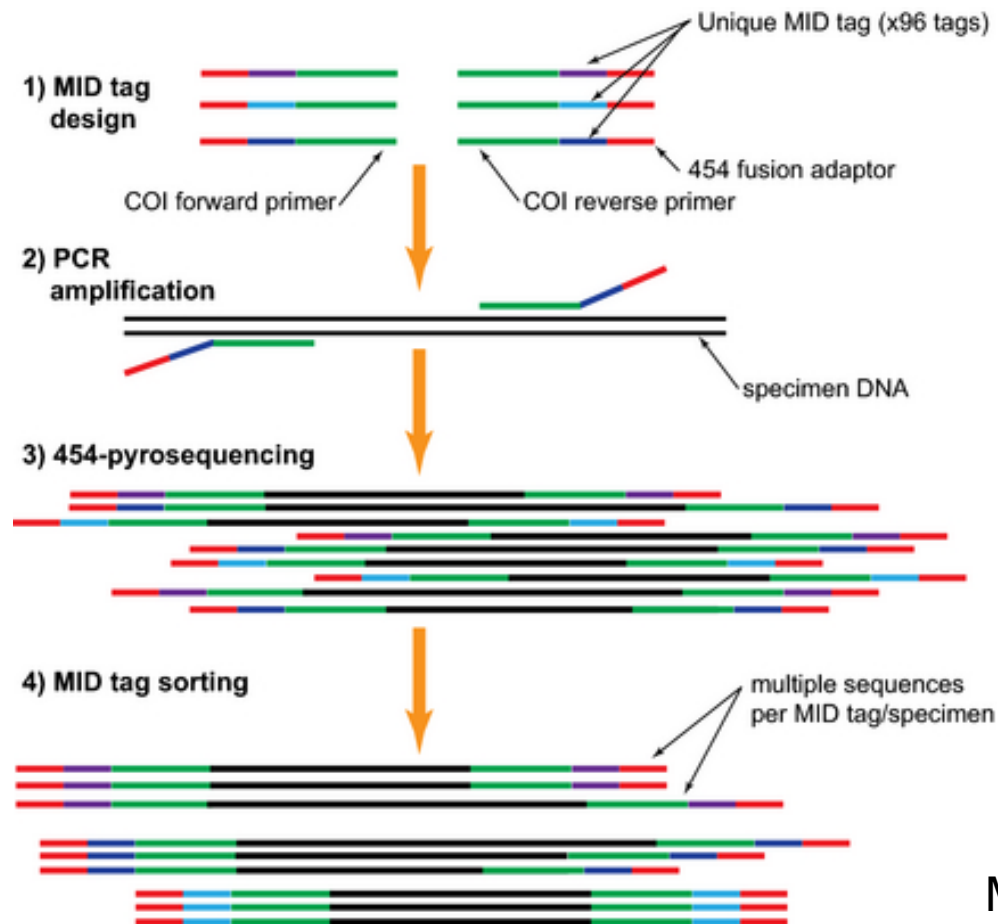

- 200-1000 baspairs
- 100 000 – billions of sequences
- Hours to days
- Clonal sequencing – each starting from single molecule amplified millionfold
- 'Semi-quantitative'
- Gbp per day

## Fast technological development, price drops

## Tagging (other 'barcodes') of samples to be able to sequence together and separate after

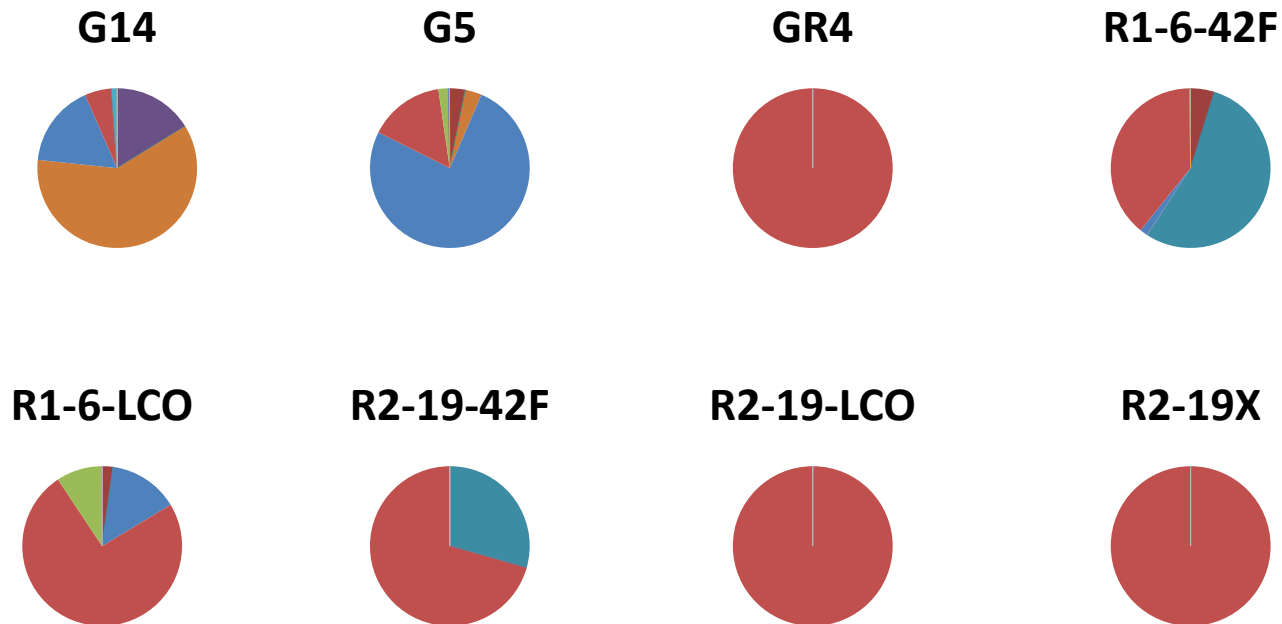

## Metabarcoding of chironomids in benthic samples

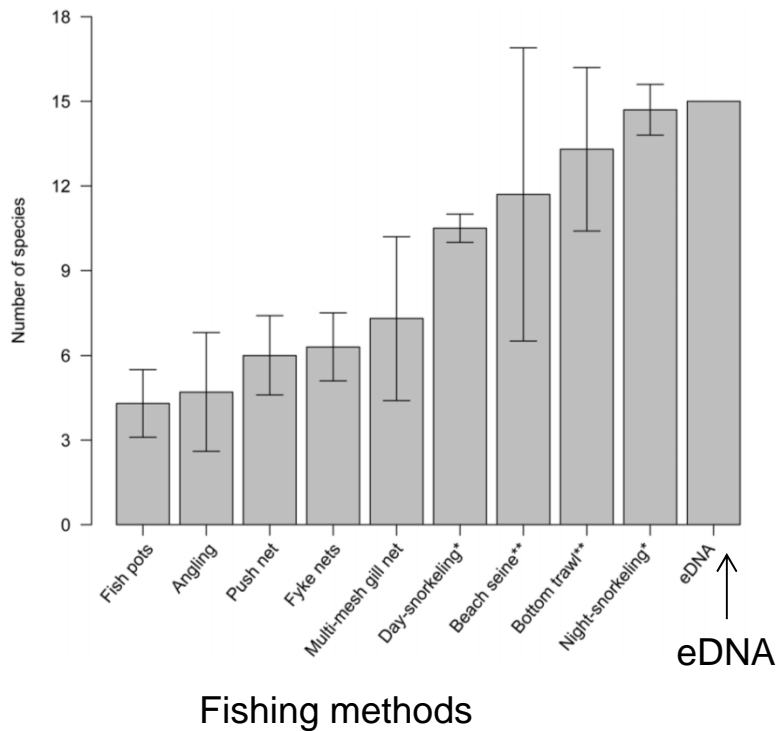

- 20 benthic samples per year from Bothnian Bay (UMF)
- Bulk samples from 8-10 stations sequenced together in NGS
- 150 bp of CO1 barcode sequence (minibarcodes)
- Samples tagged to separate the stations
- BLAST matching against local database
- Proportion of different species at the different stations

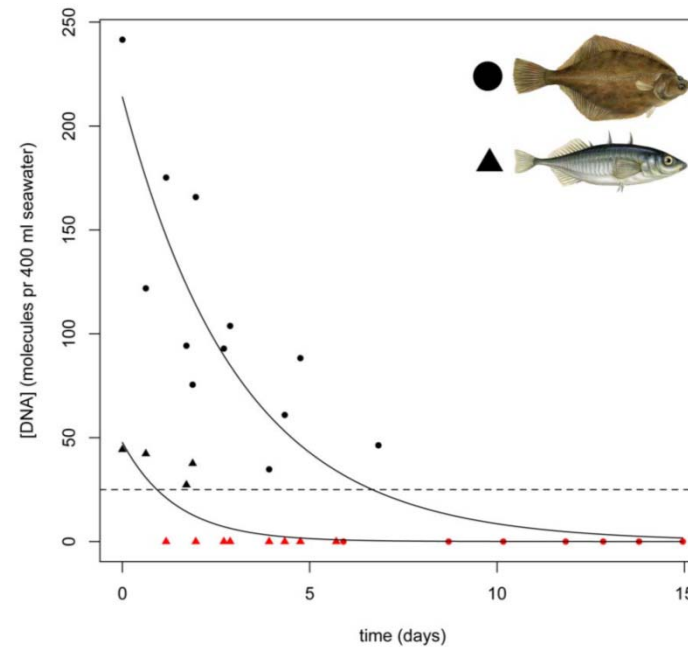

## Proportions of chironomid spp at Bothnian Bay benthic stations

# Survey of fish fauna in Danish coastal waters

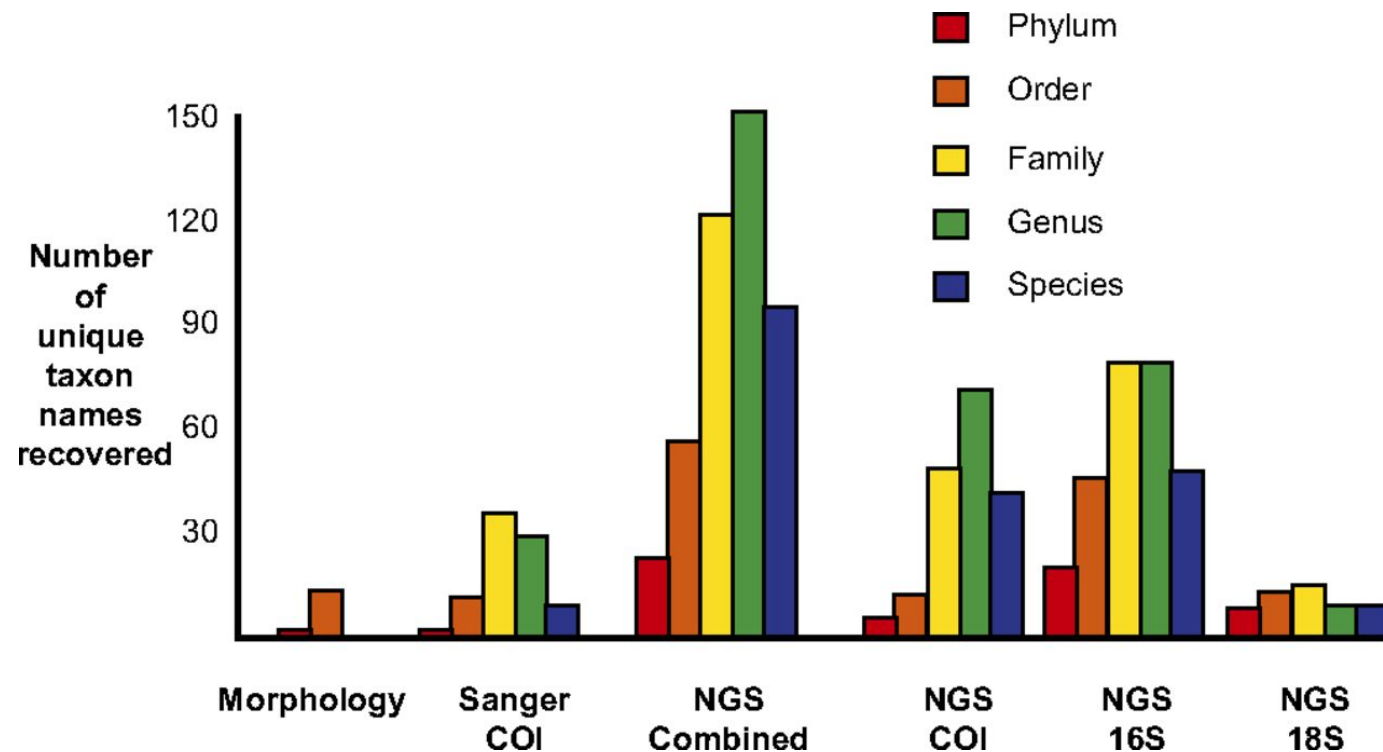

Number of species detected

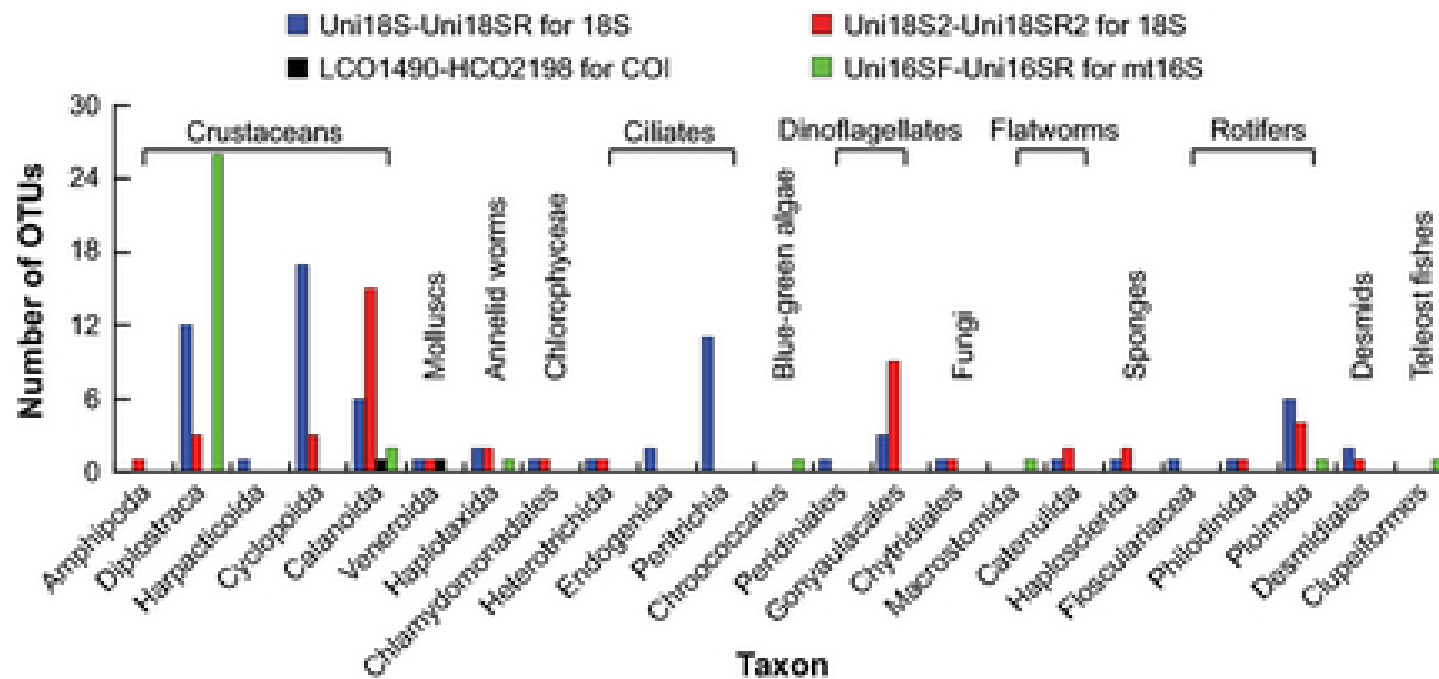

DNA degradation in aquarium (< 1 week)

Number of unique taxon names recovered by three different methods: morphological identification, Sanger sequencing of individuals, and NGS of COI, 16S, and 18S gene regions.

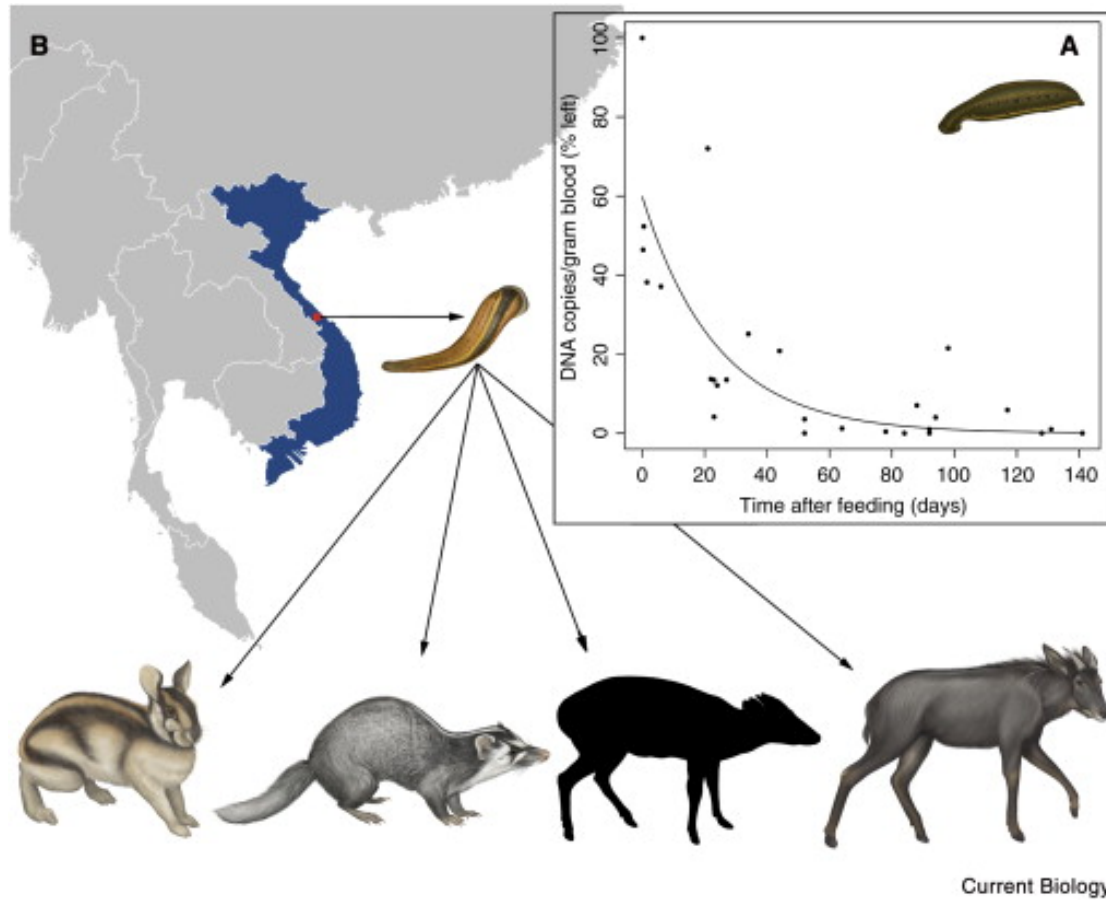

## Performance comparison of genetic markers for high-throughput sequencing-based biodiversity assessment in complex communities

Plankton community, Ontario, Ca

Mol Ecol Res 14, 1049-1059

## Screening mammal biodiversity using DNA from leeches

Current Biology

## Carnivore diet analysis based on next-generation sequencing: application to the leopard cat (*Prionailurus bengalensis*) in Pakistan

Blocking primer masking leopard cat (right)

## Swedish Museum of Natural History [www.nrm.se](http://www.nrm.se)

- Dep of Bioinformatics and genetics
- Centre for genetic identification (CGI) [cgi@nrm.se](mailto:cgi@nrm.se)
- Taxonomic expertise
- Large collections, searchable databases [www.naturarv.se](http://www.naturarv.se)
- DNA reference database portal: [www.dnanyckeln.se](http://www.dnanyckeln.se)
- Tissue collection

## Conclusions

- DNA barcoding gives quality assured identifications
- Potential for large scale environmental monitoring, NGS, eDNA
- Invasive species monitoring
- Non-invasive tracking of endangered species
- Difficult taxa and life stages
- Prioritized taxa – Which taxonomic level is required?
- Reference database involving taxonomic expertise
