

Aggregated data, maps and microdata from the Swedish National Forest Inventory

Anna-Lena Axelsson, SLU and Swedish National Forest Inventory

Sweden is a land of forests and many ecologists use data from the Swedish NFI for large-scale studies or modelling. The data is also useful for international or global studies as similar datasets exist in other countries. We will provide an overview of open data sources and quickly demonstrate a number of web-based analysis tools that you can use to explore our aggregated data. We will inform about the services provided by the [research support function](#) and give information on how to proceed if you want to order microdata, tailored datasets or specific analysis or just discuss a research idea that involves NFI data with an experienced NFI analyst.
